TokTickIT Lab 4 Final Submission Report

Nine-part release evidence for Issue #56

Answer Part 1 - Git Use with Engineering Workflow

The ordered Lab 4 workflow is recorded in reviewer.md: Issues #51-#55 were implemented on feature branches, reviewed, and merged into lab4-staging; the final release branch then targets main through PR #62. The final Issue #56 remains pending formal approval and teammate merge, so no post-merge main result is claimed.

PR #62 and commit history

README

.gitignore

The committed repository tree and the evidence folders provide the required directory-structure record; the final Kanban and main-branch checks are explicitly a post-merge gate.

Answer Part 2 - Spec DD

The rendered specification contract defines numbered requirements, business rules, Actions Taken behavior, Ticket transition rules, dashboard calculations, acceptance criteria, migration decisions, and the Product Definition of Done. It was committed before the implementation PRs were completed.

specification.md

api-spec.md

ui-spec.md

Rendered excerpts in this report cover the contract headings and link directly to the committed source documents so a grader can inspect the full numbered requirements.

Answer Part 3 - Test DD and Traceability

The Test DD maps acceptance criteria to actual server unit/API/integration tests, client UI tests, authorization/workflow tests, regression suites, and Playwright journeys. The final run reports server 22 files/136 tests, client 20 files/66 tests, and Playwright 30 total with 28 passed and 2 documented responsive variants skipped by the project guard.

client Lab 4 tests

Playwright Lab 4 tests

Answer Part 4 - AI Use with Reflection

The AI-use record names OpenAI Codex (GPT-5), preserves ten selected specification/coding/review prompts, and includes a reflection that treats the handout, repository contracts, tests, and peer review as authoritative. It records rejection of suggestions that weaken authorization, overwrite work, expose credentials, or claim unexecuted tests.

ai-use.md (LLM identity, selected prompts, and My Reflection)

Answer Part 5 - Working IT Staff Dashboard UI

The IT Staff and Administrator dashboards expose approved operational metrics, current-user Actions Taken, recent/urgent Tickets, exact query-backed counts, drill-down destinations, loading/empty/forbidden/error states, and responsive behavior. The smoke test now waits for loading to finish and for real metric content before measuring the performance budget.

Answer Part 6 - Working Actions Taken UI

Ticket Detail supports list/create/assign/edit/complete/cancel flows, validation, inactive-assignee rejection, role restrictions, safe failure and retry states, and multiple Actions Taken on one Ticket. Requesters receive a read-only history while staff/admin users receive authorized controls.

ActionsTaken.test.tsx

actions-taken-flow.spec.ts

actions-taken API tests

Answer Part 7 - Working Ticket Workflow

The workflow covers all permitted status transitions, stable ordering, append-only Action evidence, role-appropriate visibility, confirmation-required terminal transitions, stale-update conflicts, completed Action evidence, outstanding follow-up blocking, follow-up resolution audit/versioning, and reopen behavior.

TicketWorkflow.test.tsx

ticket-resolution.spec.ts

Answer Part 8 - Working Requester Dashboard and Final Regression UI

Requester metrics are ownership-scoped and drill down to recent and attention-required Tickets without leaking another requester's data. The regression matrix retains authentication, My Tickets, Ticket Detail, attachments, public comments, IT Staff functions, internal notes, and Administrator user management across the approved Lab 1-3 suites.

Answer Part 9 - Zen Green UI, Responsive, Accessibility, and Final Polish

The committed ui-spec.md defines the Zen Green tokens and shared components. Release screenshots cover desktop, tablet, and mobile requester/staff/admin dashboards, Actions Taken, loading, empty, error/retry, forbidden, and resolution-gate states. The checklist verifies readable labels, keyboard/focus behavior, live feedback, clipping/overlap, and page-level horizontal overflow.

final Markdown report

The final integration gate remains explicit: formal peer approval, teammate merge into main, and post-merge verification of the PDF, documents, six Issues, and Kanban board are still required.
